EST 28-MAR-1999
                  germ cell tumors, and was then primed with a Not I -
oligo(dT) primer. Double-stranded cDNA was ligated to Eco
RI adaptors (Pharmacia), digested with Not I and cloned
into the Not I and Eco RI sites of the modified pT7T3
vector. Library is not normalized. Library was
constructed by Bento Soares and M. Fatima Bonaldo. "

/clone_morgan: pooled; Vector: pT7T3D-Pac (Pharmacia) with
a modified polylinker; Site 1: Not I; Site 2: Bcc RI;
Equal amounts of plasmid DNA from three normalized
libraries (fetal lung NbHL)9W, testis NHT, and B-cell
NCI CGAP GCB1) were mixed, and ss circles were made in
vitro. Following HAP purification, this DNA was used as
tracer in a subtractive hybridization reaction. The driver
was PCR-amplified cDNAs from pools of 5,000 clones made
from the same 3 libraries. The pools consisted of
I.M.A.G.E. clones 297480-3020997, 682632-687239,
726408-728711, and 729096-731399. Subtraction by Bento
Soares and M. Fatima Bonaldo.

/not CGAP_Sub2 library is a subtracted library derived from BI. BI constitutes a mixture of 21 normalized or subtracted NCI CGAP libraries: NCI CGAP CO4,
NCI CGAP Pr22, NCI CGAP Pr28, NCI CGAP Ed12,
NCI CGAP Ed15, NCI CGAP Ed28, NCI CGAP Ed12,
NCI CGAP Ed3, NCI CGAP Ed28, NCI CGAP Ed12,
NCI CGAP Ed2, NCI CGAP Ed58, NCI CGAP Ed12,
NCI CGAP Ed2, NCI CGAP Ed58, NCI CGAP Ed12,
NCI CGAP Ed2, NCI CGAP Ed58, NCI CGAP Ed12,
NCI CGAP Ed2, NCI CGAP Ed58, NCI CGAP Ed12,
NCI CGAP Ed28, NCI CGAP Ed28, NCI CGAP Ed12,
NCI CGAP Ed28, NCI CGAP Ed28, NCI CGAP Ed12,
NCI CGAP Ed28, NCI CGAP Ed28, NCI CGAP Ed12,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tumor Gene Index

tumor New isolated peptides which bind to HLA-A29 molecules, which are trejection antigens used for detection and therapy of pathological conditions, e.g. cancer.

Example 13; Fig 4; 62pp; English.

The present invention describes peptides which bind to human leukocyte antigen (HLA) A29 (HLA-A29) molecules. The peptides are processed into tumour rejection antigens. They can be used for detecting cytolytic T lymphocytes (CTLs) in pathological conditions such as cancer and in HLA-typing assays. Complexes of HLA-29 molecules and the peptides can be used for stimulating CTLs in vivo. The present sequence represents a GAGE tumour rejection antigen clone, from an example from the present

They can be used for detecting cytolytic Tlymphocytes (CTLs) in pathological conditions such as cancer and in HLA-typing assays. Complexes of HLA-29 molecules and the peptides can be use for stimulating CTLs in vivo. The present sequence represents a GAGB tumour rejection antigen clone, from an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human leukocyte antigen; HLA-A29; tumour rejection antigen; detection

The present invention describes peptides which bind to human leukocyte antigen (HLA) A29 (HLA-A29) molecules. The peptides are processed into lumour rejection antigens. They can be used for detecting cytolytic T lymphocytes (CTLs) in pathological conditions such as cancer and in HLA-typing assays. Complexes of HLA-29 molecules and the peptides can be used for stimulating CTLs in vivo. The present sequence represents a GAGE tumour rejection antigen clone, from an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          188

The present invention describes a method (M1) for screening for an antinopolastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in AB161664 to AB170110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           300

The present sequence encodes a GAGE-6 tumour tumour rejection antigen precursor (TRAP). The protein is expressed in a number of tumours. In contrast the only normal itsue which expresses GAGE TRAP protein is testis. Several GAGE TRAPs have been identified (see AAV18717-21). The major difference between these proteins and GAGE-1 (AAV05540) is the absence of a stretch of 143 bases located at position 379 to 521 of the CAGE-1 TRAP sequence. The rest of cated a position, with the exception of GAGE-3 whose 5 end is totally different from the other GAGE CDNAs for the first 112 bases. This region of GAGE-3 conditions and sequence of a TRAP or presentation of a tumour rejection antigen. Antigens shed into blood or urine can be observed and then used to confirm a diagnosis of melanoma using cytolytic T cell clone proliferation methodologies. Other uses for the processed peptides, include HLA-typing assays for, e.g. skin graft or organ transplants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120

The method comprises contacting a biological sample from the patient with a polynuchocitide that selectively hybridises to a sequence that is 80 % identical to a table of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059 encode the human bladder cancer-associated proteins given in ABR48146 to ABR48242). Bladder cancer-associated sequences from the present invention have cytostatic activities, and can be used in antisense gene therapy and in vaccine production. The method can be used for detecting a bladder cancer-associated transcript in a cell from a patient. The method is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ø

                                                                                                                                                                                                                                                                                                                                                                                          09
useful in diagnosing or treating bladder cancer and in screening for compounds that modulate bladder cancer, such as hormones or antibodies. The nucleic acid molecules from the present invention may be used in various screening and diagnostic methods, and for gene therapy, vaccine and/or antisense/inhibition applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CAATCACAGTGTTAAAAGAAGACACGTTGAAATGATGATGCAGGCTGCTCCTATGTTGGAAAT

                                                                                          à
                                                                                                                                                                                                                                                                                                    The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynuclectide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer-associated polynuclectides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to creat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                             lung cancer or other benign or precamerous lesions, e.g. arelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polynucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              121

The present sequence encodes a GAGE-5 tumour tumour rejection antigen precursor (TRAP). The protein is expressed in a number of tumours. In contrast the only normal tissue which expresses GAGE TRAP protein is testis. Several GAGE TRAPs have been identified (see AAV18717-21). The major difference between these proteins and GAGE-1 (AAV05540) is the absence of a stretch of 143 bases located at position 379 to 521 of the GAGE-1 TRAP sequence. The rest of the sequences show mismatches at various position, with the exception of GAGE-3 whose 5' end is totally different from the other GAGE cDNAs for the first 112 bases. This region of GAGE-3 can be used to diagnose melanomas, characterised by expression of a TRAP or presentation of a tumour rejection antigen. Antigens shed into blood or urine can be observed and then used to confirm a diagnosis of melanoma using cytolytic T cell clone proliferation methodologies. Other uses for the processed peptides, include HLA-typing assays for,

The present invention describes peptides which bind to human leukocyte antigen (HiA, A29 (HiA-A29) molecules. The peptides are processed into tumour rejection artigens. They can be used for detecting cytolytic T lymphocytes (CTLs) in pathological conditions such as cancer and in HIA-typing assays. Complexes of HIA-29 molecules and the peptides can be used for stimulating CTLs in vivo. The present sequence represents a GAGE

AB017575 to AB020506 represent isolated polynucleotide (I) sequences, and ABP5446 to ABP54472 represent protein (II) sequences, from the present invention. (I) and (II) have cytostatic activity and can be used in gene therapy and vaccines. (I), (II), antibodies and compositions from the present invention are useful for diagnosing, preventing and treating cancer, which expresses CT or CP mRNA antigens. They are useful for stimulating immune response. They an also be useful in virology, incrobiology, molecular biology and recombinant DNA techniques. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New immunogenic polynucleotides or polypeptides useful for diagnosing, preventing and treating cancer expressing CT or CP mRNA antigens, and in virology, immunology, microbiology, molecular biology and recombinant DNA

                                                                                                                                 g
                                                                                                                                                                        ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleic acid molecules encoding them. The invention also relates to an expression vector comprising an isolated nucleic acid molecule of the invention operably linked to a promoter, a recombinant cell comprising the isolated nucleic acid molecule or the expression vector and an expression kit useful in generating cytolytic T lymphocytes (CTLs) or determining if CTLs are present in a sample comprising that encodes a human leakecyte antigen (HLA) molecule. The GAGE-7B and GAGE-8 mucleic acid molecules encode tumour rejection antigen precursors, which complex to major histocompatibility complex (MHC) molecules to facilitate the proliferation of cytolytic T cells. This sequence represents CDNA proliferation of cytolytic T cells. This sequence represents CDNA on chromosome Xp11.2-p11.4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240

The invention relates to isolated GAGE-7B and GAGE-8 polypeptides and the nucleic acid molecules encoding them. The invention also relates to an expression vector comprising an isolated nucleic acid molecule of the invention operably linked to a promoter, a recombinant cell comprising the isolated nucleic acid molecule or the expression vector and an expression kit useful in generating cytolytic T lymphocytes (CTLs) or determining if CTLs are present in a sample comprising the isolated nucleic acid molecule and the isolated nucleic acid molecule and the isolated nucleic acid molecule and the isolated nucleic acid that encodes a human nuclecules encode tumour rejection antigen precursors, which complex to major histocompatibility complex (MHC) molecules to facilitate the proliferation of cytolytic T cells. This sequence represents cDNA encoding the human GAGE-8 polypeptide of the invention. The gene resides on chromosome Xp11.2-p11.4.
                                                                                                                                                                                                                                                                                                                                                                                                    Ξ,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          190
      New GAGE-7B and GAGE-8 nucleic acid molecules, useful in coding for tumor rejection antigen precursors, which complex to major histocompatibility complex molecules to facilitate the proliferation of cytolytic T cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             130

precursor (TRAP). The protein is expressed in a number of tumours. In contrast the only normal tissue which expresses GAGE TRAP protein is testis. Several GAGE TRAPs have been identified (see AAV18717-21). The major difference between these proteins and GAGE-1 (AAV05540) is the major difference between these proteins and GAGE-1 (AAV05540) is the GAGE-1 TRAP sequence. The rest of the sequences show mismatches at various position, with the exception of GAGE-3 whose 5' end is totally different from the other GAGE CDNAS for the first 112 bases. This region of GAGE-3 DNA contains a long repeat and a hairpin structure. The antigens can be used to diagnose melanomas, characterised by expression of a TRAP or presentation of a tumour rejection antigen. Antigens shed into blood or unine can be observed and then used to confirm a diagnosis of melanoma using cytolytic 7 cell clone proliferation methodologies.
                                     GAGE tumour tumour rejection antigen precursor; TRAP; tumour; diagnosis; melanoma; antigen; cytolytic T cell clone proliferation; HLA-typing assay; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated nucleic acid encoding GAGE tumour rejection antigen precursor -processed by {\rm HLA}\text{-}{\rm CW6} molecules into peptides, useful to diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CGCCAGGGAGCTGTGTGGCGGTGCTGTG----TTCTTGCGTCCGGACTCTTTTCCTCTT

The present sequence is one of a large number of S' ESTS derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The S' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the S' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTS are derived from mRNAs with intact S' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. S' ESTS are also used in diagnostic, forensic,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAAAGCAATCCCAGTGTTAAAANAAGGCNCGTTGAAATGATGCAGGCTGCTCCTATGTTG 150
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          markers for determining the sensitivity of a cancer cell to the anticancer agent TAXOL. Cancer cells can be treated with TAXOL when they are shown to express one of the 242 sensitivity markers or the cells are shown not to express one of the 804 resistance markers. The methods can be used to determine the effectiveness of TAXOL in the treatment of cancer cell growth in an individual. The markers can be used as targets in developing anti-cancer agents such as chemotherapeutic compounds. The markers can also be used as targets in developing treatments for cancer, particularly those cancers which display resistance to agents and exhibit expression of the markers. The anticancer agents developed by the novel method can be used to treat cancer. Probes based on the markers can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         296
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 330
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        356

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    used to detect transcripts or genomic sequences corresponding to the markers, in the identification of cells or tissues which mis-express the protein. Cancers which may be targeted include carcinoma (e.g. squamous cell carcinoma), sarcoma (e.g. fibrosarcoma) leukaemia (e.g. lymphocytic leukaemia), lymphoma, plasmocytoma, reticulum cell sarcoma, Hodgkin's disease and tumours (e.g. glioma). The present sequence is one of the 1046 novel cancer cell markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAAAGCAATCACAGTGTTAAAAGAAGGCACGTTGAAATGATGCAGGCTGCTCCTATGTTG
